**Figure S1. Marker Gene Expression.** Marker gene expression levels across 12 samples in corresponding layers demonstrate MGGNN's superior alignment with domain knowledge. All marker genes used for spot identification are listed.

Marker gene expression levels across 12 samples in their corresponding layers demonstrate MGGNN's superior alignment with domain knowledge. Figure 1 shows all the marker genes used for spot identification. MGGNN successfully outputs results aligned with domain knowledge, as the expression of marker genes is predominantly observed in their corresponding layers.

 Table S1. The ARI results for each sample from the DLPFC dataset.

This is a quantitative demonstration of Figure 3b. The highest ARI values are listed in bold in the table. MGGNN achieved competitive ARI scores compared to competing methods (7 out of 12), while the second-place method, GraphST, attained the highest ARI values in 2 samples.

Table S2. The ARI results for each sample from the Coronal Mouse Brain dataset.

This is a quantitative demonstration of Figure 4b. The highest ARI values are listed in bold in the table. MGGNN outperforms all competing methods on this dataset with the help of reliable marker genes.
